From:

Sent:

Schnizer, Richard Wednesday, August 27, 2003 2:28 PM STIC-Biotech/ChemLib 09/965,594

To:

Subject:

Please search the commercial and published application databases for polypeptide SEQ ID NOS: 1, 12, 14, 16, 18, 20, 22, and 26 from 09/965,594. Please also search for nucleic acids that could encode these polypeptides.

Thank you-

Richard Schnizer, Ph.D. Patent Examiner Art Unit 1635 CM1 12E17 703-306-5441 Mail Box CM1 11E12

                                                                                                                                                                                                                                                  ó
                                                        The present sequence is the Hepatitis C virus (HCV) NS3 protease enzyme. This protein is essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. NS4A is also needed for this process and inhibitors of the HCV genome. NS4A is also needed for this process and inhibitors of the useful as HCV can lead to chronic liver disease such as cirrhosis. Invertailure and liver cancer. The present invention concerns a cumber of failure and NS3 matarits and NS3 NS4A faison proteins which can be used to identify inhibitors of this type, as well as enabling structural studies of the protease and protease inhibitor complexes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention relates to hepatitis C virus (HCV) core antigen and NS (nonstructural) 3,4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is HCV-1 NS3/4a mutant conformational antigen. This sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Hepatitis C virus; HCV; NS3/4a conformational epitope; seroconversion; immunoassay solid support; multiple epitope fusion antigen; MEFA; non-structural protein; mutant; mutein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to a new immunoassay solid support consisting essentially of at least one hepatitis C virus (HCV) NS3/4a conformational epitope and a multiple epitope fusion antigen (MEPA), bound to the support. The NS3/4a conformational epitope and/or MEPA reacts specifically with anti-HCV antibodies prosent in a biological sample from an HCV-infected individual. The immunoassay of the invention is useful for detecting hepatitis C virus infection in a biological sample. The method of the invention provides a sensitive, accurate diagnostic and prognostic tool to provide adequate patient care and to prevent transmission of HCV by blood and by blood products, or by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9
                                                                                                                                                                                                                                                                                                                                 personal contact. Use of NS3/4a conformational opinod products, or by personal contact. Use of NS3/4a conformational opinope in combination with MEFA, provides a sensitive and reliable method for detecting early HCV seroconversion. Use of MEFA has the added advantages of decreasing ansaking problems, improving sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit surface area of substrate, and improving substrate, Detection accuracy is increased and the incidence of false results is reduced because of the identification and the use of highly immunogenic HCV antigons which are present during the early stages of HCV seroconversion. The present amino acid sequence represents the non-structural protein NS3/4a conformational epitope of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1 MAPITAYAQQTRGLLGC11TSLTGRUKNQVFGEVQIVSTAAQTFLATC1NGVCWTVYHGA

The present invention relates to immunoassays comprising Hepatitis C Virus (HCV) NS3/da conformational epitope and multiple epitope fusion antigen (MEFA), bound to a solid support. The NS3/da epitope and/or the multiple epitope fusion antigen react with anti-HCV antibodies present in a biological sample from an HCV-infected Individual. The immunoassays and methods of the invention are useful for detecting that it is support provides a sensitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection acused by any C six known genotypes of HCV. The use of the multiple epitope fusion proteins decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence represents HCV-1) NS3/da conformational antigen, a mutant of the HCV-1 NS3/da polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               61 GTRTIASPKGPVIQWYINVDQDLVGWPAPQGSRSLTPCTCGSSDLYLVTRHADVIPVRRR 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  RNA was isolated from the plasma of a HCV seropositive human (designated "LG") and CDNA was prepared from it. The CDNA was PCR amplified using specific primers with sequences based on the prototype HCV-1 CDNA sequence (GENBANK M65321). Further amplification using nested primers resulted in 7 adjacent HCV DNA fragments which could be assembled into a foil-length sequence. The DNA sequence was determined and translated into the genomic amino acid sequence. Comparison of the LG genomic amino acid sequence with that from HCV-1 showed 134 amino acid differences.
                                                                                                                                                                                                                                                                        HCV genomic amino acid sequence isolated from infected human 13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New plasmid pHCV-162 is a mammalian expression systems for HCVT proteins – useful for diagnosing HCV infection and as vaccines for preventing HCV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ó

These antigens react with antibodies in patients with non-A non-B hepatitis (NANBH). They can be used to diagnose HCV-induced NANBH, to raise antibodies for immunoasasy or treatment, or to produce vaccines. (Updated on 25-MAR-2003 to correct PR [ield.)

```

```
It is the sequence encoded in the open reading frame of hepatitis C virus (HCV) cDNA inserts in clones 12f through 15e. It is antigenic and could be used in immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

The polypeptides are used to diagnose HCV-induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines.

(N.B. This record was resubmitted to correct errors in the sequence.) (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      9
                                                                                                                                                                                                                                                          The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynuclectide. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypectide level to a HCV polyprotein. The antisense polynuclectide binds to cellular polynuclectides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynuclectides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence is encoded by a novel HCV cDNA sequence, which is used in the course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    GTRTIASPKGPVIQMYTNVDKDLVGWPAPQGSRSLTPCTCGSSDLYLVTRHADVIPVRRR

                                                                                                                                                                                                                    This sequence represents the entire hepatitis C virus polyprotein. HCV is a member of the flavivirus family and appears to encode a basic polypeptide domain ("C") at the N-terminal of the viral polyprotein, followed by two glycoprotein domains ("E1", "E2/NS1"), upstream of the nonstructural genes NS2 through NS5.                                                                                                                                                                                                                               AAR70230 is the composite hepatitis C virus (HC-J1/CDC/CHI) protein from which the synthetic HCV antigens described in AAR70210-R70229 were derived. These synthetic antigens can be used to screen blood, or blood products for the presence HCV, they can also be used in various specific assays for the detection of HCV antibodies, and antigens, or as immunogens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    80
                                                                                                                                                                                                                                                                     The present sequence is the coding sequence for the Hepatitis C virus (HCV) NS3 protease enzyme. This protein is essential for the replication of the virus, acting to cleave its replicative proteins from the polyprotein produced from the HCV genome. NS4A is also needed for this process and inhibitors of the two proteins should act as antiviral treatments of HCV infection. This is useful'as HCV can lead to chronic liver disease such as cirrhosis, liver failure and liver cancer. The present invention concerns a number of NS3 mutants and NS3-NS4A fusion proteins which can be used to identify inhibitors of this type, as well.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          9

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to hepatitis C virus (HCV) core antigen and NS (nonstructural) 3/4a antibody combination assay that can detect both HCV antigens and antibodies present in a sample using a single solid matrix as well as immunoassay solid supports for use in the assay. The solid support is useful for detecting HCV infection in a biological sample. The present sequence is a DNA encoding HCV-1 NSJ/4a mutant conformational antigen. This sequence is used in the exemplification

The present invention relates to a new immunoassay solid support consisting essentially of at least one hepatitis C virus (HCV) NS34a conformational epitope and a multiple epitope fusion antigen (MEPA).

Conformational epitope and a multiple epitope fusion antigen (MEPA).

Bound to the support. The NS3/4a conformational epitope and/or MEPA reacts specifically with anti-HCV antibodies present in a biological sample from an HCV-infected individual. The immunoassay of the invention is useful for detecting hepatitis C virus infection in a biological sample. The method of the invention provides a sensitive, accurate prevent transmission of HCV by blood and by blood products, or by prevent transmission of HCV by blood and by blood products, or by personal contact. Use of NS3/4a conformational epitope in combination with MEPA, provides a sensitive and reliable method for detecting early HCV seroconversion. Use of MEPA has the added advantages of decreasing masking problems, improving sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit surface area of substrate, and improving substrate. Detection accuracy is increased and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              the incidence of false results is reduced because of the identification and the use of highly immunogenic HCV antigens which are present during the early stages of HCV seroconversity the present nucleic acid sequence encodes the non-structural protein NS3/4a conformational epitope of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     61 AGCCTAACTGGCCGGGACAAAACCAAGTGGAGGGTGAGGTCCAGATTGTGTCAACTGCT 120

The present invention relates to immunoassays comprising Hepatitis C Virus (HCV) NS3/da conformational epitope and multiple epitope fusion antigon react with anti-HCV antibodies antigon (MEPA), bound to a solid support. The NS3/da epitope and/or the multiple epitope fusion antigen react with anti-HCV antibodies present in a biological sample from an HCV infected individual. The immunoassays and methods of the invention are useful for detecting HCV infection in a biological sample. The inventive immunoassay soils support provides a sensitive and reliable method for detecting early HCV seroconversion. The assays can detect HCV infection caused by any HCV seroconversion. The assays can detect HCV infection caused by any proteins decreases masking problems, improves sensitivity in detecting antibodies by allowing a greater number of epitopes on a unit area of substrate, and improves selectivity. The present sequence encodes HCV type I (HCV-I) NS3/da conformational antigen, a mutant of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones 14; 11b, 7f, 7e, 8h 33c, 40b, 35b, 36, 31b, 32c, 14c, 8f, 31f, 31g, and 39c of hepatitis C virus (HCV) CDNA. In creating the composite sequence the following heterogenelities were considered. Clone 33c contains a sequence of 800 base pairs which overlaps the cONAs in clones 40b and 37c. In clone 33c, as well as in 5 other overlapping clones, nucleotide #789 is a G. However, in clone 37b the corresponding nucleotide is an A. This heterogenity may have important ramifications for protein folding. Nucleotide #2 in clone 8h is a T which may represent a cloning artifact because the corresponding residue in clone 7e and in 3 other overlapping clones is an A. Therefore the residue in this position is designated as a C. Then a G because the corresponding residue in clone 31f is represented as a T than a G because the corresponding residue in clone 31f and in 2 other overlapping clones is a T. The 3' terminal sequence of clone 33f is represented as ATTC, as is found in the corresponding sequence in clone 31g and in 2 other overlapping clones 33f, no clone 33f. Residue #4 in clone 33f and 2 other corresponding residue in clone 33f
                                                                                                                                                                                                 Combined open reading frames of the hepatitis C virus (HCV) CDNA in clones 14i 11b, 7f, 7e, 8h, 33c, 40b, 37b, 35, 36, 81, 32, 33b, 25c, 14c,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                closes is an A. The 3'-terminus of close 141 is depicted as TA rather than AA because the corresponding dinucleotide in clone 11b and 3 other closes is TA. Potential cloning artifacts have been omitted and instead the corresponding sequences in non-5'-terminal regions of multiple overlapping clones are shown. AANO2097 could be used as a source of oligomeric DNA hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as

Q
```

```
It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones 12f to 15e of hepatitis C virus (HCV) cDNA. It can be used to make oligomeric DNA hybridlsation probes t detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis. (Updated on 25-MAR-2003 to correct PR field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      96
                                                                                                                                                                                                                                                                                                                                                                     The sequence shows the composite cDNA sequence derived from the aligned hepatitis C virus (HCV) cDNA's in clones 14i, 11b, 7f. 7e, 8h, 33c, 40b, 37b, 35, 36, 81, 32, 33b, 25c, 14c, 8f, 33f, 33f and 39c. The cDNA encodes antigens which react with antibodies in patients with non-A non-B hepatitis (NANBH). The cDNA can be used to design probes, or to synthesise polypeptides, which are used to dispasse HCV; induced NANBH, to raise antibodies for immunoassay or treatment, or to produce vaccines, see also AAP90158, AAN90303-26, and AAN90328-36.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ClyThrArgThrIleAlaSerProLysGlyProVallieGInMc.TyrThrAsnValAsp

```
It is a double-stranded nucleotide sequence of the open reading frame (ORF) (tag a) extending through clones K9-1 to 15e of hepatitis C virus (HCV) cobh. It can be used to make oligomeric DNA hybridisation probes to detect the presence of HCV nucleic acids in samples. The polypeptide(s) it encodes could be used as immunoassay reagents and vaccines and to generate antibodies useful in diagnosis and passive immunotherapy for HCV infection/non-A, non-B hepatitis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The sequence shows a composite hepatitis C virus (HCV) cDNA, derived be aligning clones k9-1 through 15e in 5'-3' direction. The CDNA encodes antiquens which react with antibodies in patients with non-a non-B hepatitis (NANBH). The CDNA can be used to design probes, or to synthesise polypeptides, which are used to diagnose HCV-induced NANBH.
Hepatitis C virus gene - used for prodn. of polynucleotide probes, polypeptide(s) and antibodies for diagnosis, prevention and treatment of infection.

                                Hepatilis C virus (HCV) antigens can be used for detecting HCV infected sera and individuals infected with HCV. They can also be used in an anti-HCV vaccine or for the production of anti-HCV antibodies which can be used for passive immunoprophylaxis. The antigens consistently identify more HCV positive serum samples with a high degree of specificity. See AAQ098202-14 and AAR81939-51. (Updated on 25-MAR-2003 to correct PF field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) ancisence polynociacided. The HCV is characterized by a positive stranded RNA genome which has 40% homology at the polypeptide level to a HCV polyproctain. The antisense polynociacide binds to cellular polynociacidetides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynocleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which causes viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present course of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     MetAlaProlleThrAlaTyrAlaGlnGlnThrArgGlyLeuLeuGlyCysIleIleThr

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 100
                                                                                                                                                         and JT. These two isolates comprise nuclectide and anino acid sequences that are distinct from the HCV isolate HCV-1. The nucleotide sequences any be used to detect non-A, non-B HCV (NAMBH) polynucleotides by screen blood donors, donated blood and blood products for this infection. The isolates may also be used to isolate other naturally occurring variants of the virus. The polypeptides may be used as a vaccine for administration to patients to protect against infection with NAMBH. The Updated on 20-MAR-2003 to correct PF field.)

A lambda 9111 library was screened with probes derived from previously isolated clones. The ORF is derived from the overlapping clones bilda, ag30a, CA205a, 12f, 14i, 11b, 7f, 8h, 33c, 40b, 37b, 35, 36, 81, 32, 33b, 25c, 14c, 8f, 31f, 39c, 35f, 19g, 26g, 15e, b5a and 16hr. These clones extend the sequence of the HCV genome reported in EP-118216. The upstream region from nucleotides -319 to -1348 (-1.1667 in this file) is covered by clones bilda, 18g, ag30a, CA205a, CA205a, CA205a, pida, cA167b, CA156e, CA84a and CA59a; nucleotides 8659-8866 (-8978-9185 in this file) are covered by clones b5a and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Hepatitis C virus DNA - used for producing probes, polypeptide(s), antibodies and anti-sense polynucleotide(s) for diagnosis and therapy.
                                                                                                                                                                                                                                                                                                                within this region is claimed"

The specification describes a pharmaceutical composition which comprises a hepatitis C virus (HCV) antisense polynucleotide. The HCV is characterized by a positive stranded RNA genome which has antisense polynucleotide by a positive stranded RNA genome which has antisense polynucleotide binds to cellular polynucleotides which enhance and/or are required for viral infectivity, replicative ability or chronicity. The antisense polynucleotides may also be designed to bind with high specificity, to be of increased stability, to be stable and to have low toxicity. The composition also comprises an agent which coarses viral RNA to be inactive. The composition is used for preventing HCV replication in a system. The present sequence represents a novel HCV cDNA sequence, which is used in the
                                                                                                                                                                                                                          /*tag= a

-i- FUNCTION: NSSB IS A RNA-DEPENDENT RNA POLYMERASE THAT FLAYS AN
ESSEMTIAL ROLE IN THE VIROS REPLICATION.
-i- CATALYTICA CALTUITY: Hydrolysis of four peptide bonds in the viral
precursor polyprotein, commonly with Asp or Glu in the P6
position, Cys or Thr in P1 and Ser or Ala in P1'.
-i- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      (RNA)(N).
SUBUNTT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS: E1 AND E2. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        NS3-NS4A, NS4A-NS4B, NS4B-NS5A AND NS5A-NS5B.
-!- FUNCTION: NS4A FORMS A COMPLEX WITH NS3 AND IS ESSENTIAL FOR THE
ACTIVATION OF NS3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein Sci. 7:837-847(1998).

-!- FUNCTION: THE SHALL PROTEINS NSZA, NSZB, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the vip precursor polyprotein, commonly with Asp or Glu in the P6 possition, Cys or Thr in Pl and Ser or Ala in Pl'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate - N diphosphate.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 virus: a 2.2-A resolution structure in a hexagonal crystal form.";

KALO N., Hijikata M., Nakagawa M., Ootsuyama Y., Muraiso K.,

Molecular structure of the Japanese hepatitis C viral genome.";

FEBS Lett. 280:325-328(1991).

I-PUNCTION: THE SHALL, PROTEINS NS2A, NS2B, NS4A AND NS4B ARE

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

I-CATALITIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or thr in Pl and Ser or Ala in Pl'.

CATALITIC ACTIVITY: N nucleoside triphosphate + CATALITIC ACTIVITY: N nucleoside triphosphate - N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (RNA)(N).
SUBUNT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
SIMILARITY: THE PROTEASE BELONGS TO PEPTIDASE FAMILY $29.

Medecular cloning of hepatitis C virus genome from a single Japanese cariser: sequence variation within the same individual and among infected individuals.":

Virus Res. 23:39-53(1992);
Virus Res. 23:39-53(1992);
Virus Res. 23:39-53(1992);
C -: FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE NS3 AND NS5 MAY PARD FOR THE VIRAL MEMBRANE-RELATED FUNCTION.
NS3 AND NS5 MAY PATA A ROLE IN THE VIRAL RNA REPLICATION.
NS3 AND NS5 MAY PATA A ROLE IN THE VIRAL RNA REPLICATION.
C -: CATANTIC ACTIVITY: Hydrolysis of four peptide bonds in the P6 position, Cys or Thr in P1 and Ser or Ala in P1.
C -: CATANTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                       01-APR-1993 (Rel. 25, Created)

Genome polyprotein [Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NSI); Protein P7; Nonstructural protein NS2 (P21)
(EC 3.4.22-); Protease/hellcase NS3 (P70) (Hepacivirin)
(EC 3.4.21-98); Nonstructural protein NSA (P4); Nonstructural protein
NSAB (P57); Nonstructural protein NSA (P4); Nonstructural protein
NSAB (P66) (P70) (RNA-directed RNA pollymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J8) (HCV).
Viruses; SSRNA positive-strand viruses, no DNA stage; Flaviviridae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           VITOLOGY 188:331-341(1992).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- CATALYTIC ACTIVITY: Hydrolysis of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 postition, Cys or Thr in P1 and Ser or Ala in P1'.

-!- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A.

Genome polyprotein (Contains: Capsid protein C (Core protein) (P22);
Envelope glycoprotein El (GP32) (GP35); Envelope glycoprotein E2
(GP68) (GP70) (NS1); Protein P7: Nonstructural protein NS2 (P21)
(EC 3 4.22.-); Protease/helicase NS3 (P70) (Hepacivirin)
(EC 3 4.21.98); Nonstructural protein NS5A (P66); Nonstructural protein NS5A (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
NS5B (P66) (P70) (RNA-directed RNA polymerase) (EC 2.7.7.48)].
Hepatitis C virus (isolate HC-J6) (HCV).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (RNA)(N).
SUBGNIT: THE VIRION OF THIS VIRUS IS A NUCLECCAPSID COVERED BY A
LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:
PROTEIN M AND GLYCOPROTEIN E. THE NUCLECCAPSID IS A COMPLEX OF
PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         InterPro; IPR002519; HCV_env
